

Central and end drain trays

Collecting drain water reduces the risk of spreading diseases. The drain water is drained off via a closed (above or below ground) central pipe. Every end drain tray comes with a vertical connection and is supplied complete with a pipe clamp, a flexible drainage pipe, fastenings and food-grade sealant as standard. Stainless steel filters and a horizontal connection are available as an optional extra. Our central and end drain trays are made of white plastic and are UV-resistant. This produces a sustainable system with an attractively clean and neat appearance.

- Drain water and fertilisers collected can be reused or drained off
- Connects seamlessly to drain channels on the growing gutter
