

V-shaped suspension and semi V-suspension

With a V-shaped or semi V-suspension near the central aisle, an extra support point is created for the gutter if it protrudes more than 75 cm beyond the first suspension. With a V- or semi V-suspension device on the end gable you can create a walkway in the greenhouse or even keep the wall free for other features. A V-suspension is often used when it is not possible to fit a gable system or at emergency exits in the end gables.

End and side gable supporting

The gable system is secured to the greenhouse column and is height adjustable. In addition, besides supporting the growing gutters, it is also suitable for suspending a gable gutter and distribution and collection pipes. On the side gables columns, gable supports are used to prevent the side gable gutter from tilting.

- Stabilises the growing gutters
- Suitable for suspending pipes
- A V-suspension allows an emergency exit to be created
