

Supports for growing gutters

In a greenhouse or tunnel structure, the load on a suspended system can be extremely high. To accommodate this weight, Meteor Systems has developed supports that raise the height of the growing gutters. Our gutter supports are galvanised and can be installed directly on the ground or on the concrete floor in the greenhouse. These gutter supports are often used in combination with bay wide supports and pipe rail supports. Meteor Systems manufactures many different types of gutter supports. Feel free to ask us for advice on the most suitable option for your crop.

- Height-adjustable
- Suitable for both soft and hard surfaces
- Can be combined with bay wide supports and/or pipe rail supports
